

FER-150. Figure 5H. Fault-related features and diagnostic geomorphic surfaces in the Santiago Creek quadrangle visible on U.S. Department of Agriculture (1952) aerial photographs. Solid line indicates feature or contact appears well-defined; dashed line indicates features or contacts are less well-defined.

- = scarp or escarpment which appears to coincide with a contact between two different rock units; may be fault or landslide produced
- = contact, well-defined and accurately located
- = contact, poorly defined or approximately located
- Qa** = alluvium (probably Holocene)
- Qoa** = older alluvium (probably Pleistocene)
- = landslide deposits (selectively shown)
